Pima Indians Diabetes Analysis

As a result of a research done in Pima Indians tribe, it was found that the ladies are prone to diabetes very early.

Analyze different aspects of Diabetes in the Pima Indians tribe by doing Exploratory Data Analysis.

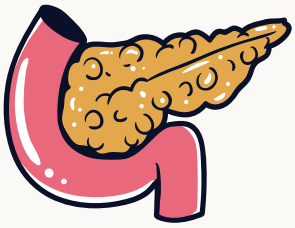
Python | Jupyter Notebook

1. Overview of the dataset
2. Summary statistics of the data
3. Distribution plot (blood pressure)
4. Pairplot for different variables
5. Scatterplot between glucose and insulin
6. Boxplot and histograms (age)
7. Correlation matrix

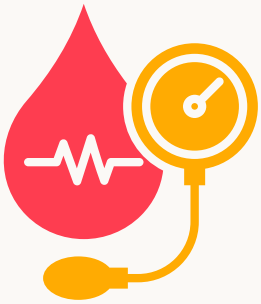
HEALTH INSIGHTS

1. There is a mild correlation between pregnancies and age (0.54).

2. An interesting relation between glucose and insulin (0.4), which is reasonable because the medical literature shows that insulin is a hormone made by the pancreas that helps glucose.



3. There is a little correlation between age and blood pressure (0.33). Some people with high blood pressure are older, but it is not a rule.



LESSONS & PERSPECTIVES

1. There is a little correlation between glucose and blood pressure (0.22), the same with BMI and glucose (0.23).
2. So it's a concern to consider other variables (such as present chronic diseases and eating habits) in the study.
